School of Computer and Communication Sciences

PROBLEM 1.

- (a) We have $H(f(U)) \le H(f(U), U) = H(U) + H(f(U)|U) = H(U) + 0 = H(U)$.
- (b) Notice that $U \oplus V \oplus f(V)$ is a Markov chain. The data processing inequality implies that $H(U) - H(U|f(V)) = I(U; f(V)) \leq I(U; V) = H(U) - H(U|V)$. Therefore, $H(U|V) \leq H(U|f(V)).$

PROBLEM 2.

(a) We have:

$$
H(U|\hat{U}) \le H(U, W|\hat{U}) = H(W|\hat{U}) + H(U|\hat{U}, W) \le H(W) + H(U|\hat{U}, W)
$$

= $H(W) + H(U|\hat{U}, W = 0) \cdot \mathbb{P}[W = 0] + H(U|\hat{U}, W = 1) \cdot \mathbb{P}[W = 1]$
 $\stackrel{(*)}{\le} h_2(p_e) + 0 \cdot (1 - p_e) + \log(|\mathcal{U}| - 1) \cdot p_e = h_2(p_e) + p_e \log(|\mathcal{U}| - 1),$

where (∗) follows from the following facts:

- $H(W) = h_2(p_e).$
- $H(U|\hat{U}, W=0) = 0$: conditioned on $W=0$, we know that $U=\hat{U}$ and so the conditional entropy $H(U|\hat{U}, W=0)$ is equal to 0.
- $-H(U|\hat{U}, W=1) \leq \log(|\mathcal{U}| 1)$: conditioned on $W=1$, we know that $U \neq \hat{U}$ and so there are at most $|U|-1$ values for U. Therefore, the conditional entropy $H(U|\hat{U}, W=0)$ is at most $log(|\mathcal{U}| - 1)$.
- (b) Let $\hat{U} = f(V)$. We have $H(U|\hat{U}) \leq h_2(p_e) + p_e \log(|\mathcal{U}| 1)$ from (a). On the other hand, from Problem 1(b) we have $H(U|V) \leq H(U|f(V)) = H(U|\hat{U})$. We conclude that $H(U|V) \leq h_2(p_e) + p_e \log(|U| - 1)$.

PROBLEM 3.

(a) Since

$$
P(U = u, Z = z) = \begin{cases} p(u) & \text{if } z = 1, \\ q(u) & \text{if } z = 2, \end{cases}
$$

one can immediately see that the distribution of U is $r(u) = \theta p(u) + (1 - \theta)q(u)$.

(b) $H(U) = h(r)$, and

$$
H(U|Z) = \sum_{z} P(Z = z)H(U|Z = z) = \theta h(p) + (1 - \theta)h(q).
$$

The last equality follows since given $z = 1$ (resp. $z = 2$) U has distribution p (resp. q). Since $H(U) \ge H(U|Z)$, we have proved that $h(r) \ge \theta h(p) + (1 - \theta)h(q)$.

PROBLEM 4.

(a) We have:

$$
S = \sum_{u \in \mathcal{U}} \max \{ P_1(u), P_2(u) \} \stackrel{(*)}{\leq} \sum_{u \in \mathcal{U}} (P_1(u) + P_2(u))
$$

=
$$
\sum_{u \in \mathcal{U}} P_1(u) + \sum_{u \in \mathcal{U}} P_2(u) = 1 + 1 = 2,
$$

It is easy to see from (*) that $S = 2$ if and only if $\max\{P_1(u), P_2(u)\} = P_1(u) + P_2(u)$ for all $u \in \mathcal{U}$, which is equivalent to say that there is no $u \in \mathcal{U}$ for which we have $P_1(u) > 0$ and $P_2(u) > 0$. In other words, $S = 2$ if and only if

$$
\{u \in \mathcal{U} : P_1(u) > 0\} \cap \{u \in \mathcal{U} : P_2(u) > 0\} = \emptyset.
$$

(b) Let $l_i = \lceil \log_2 \frac{S}{\max\{P_1(a_i)\}}\rceil$ $\frac{S}{\max\{P_1(a_i), P_2(a_i)\}}$, and let us compute the Kraft sum:

$$
\sum_{i=1}^{M} 2^{-l_i} \le \sum_{i=1}^{M} 2^{-\log_2 \frac{S}{\max\{P_1(a_i), P_2(a_i)\}}} = \sum_{i=1}^{M} \frac{\max\{P_1(a_i), P_2(a_i)\}}{S} = 1.
$$

Since the Kraft sum is at most 1, there exists a prefix-free code where the length of the codeword associated to a_i is l_i .

(c) Since the code constructed in (b) is prefix free, it must be the case that $\overline{l} \geq H(U)$. In order to prove the upper bounds, let P^* be the true distribution (which is either P_1 or P_2). It is easy to see that $P^*(a_i) \leq \max\{P_1(a_i), P_2(a_i)\}\)$ for all $1 \leq i \leq M$. We have:

$$
\overline{l} = \sum_{i=1}^{M} P^*(a_i) . l_i = \sum_{i=1}^{M} P^*(a_i). \left[\log_2 \frac{S}{\max\{P_1(a_i), P_2(a_i)\}} \right]
$$

$$
< \sum_{i=1}^{M} P^*(a_i). \left(1 + \log_2 \frac{S}{\max\{P_1(a_i), P_2(a_i)\}} \right)
$$

$$
= \sum_{i=1}^{M} P^*(a_i). \left(1 + \log S + \log_2 \frac{1}{\max\{P_1(a_i), P_2(a_i)\}} \right)
$$

$$
= 1 + \log S + \sum_{i=1}^{M} P^*(a_i). \log_2 \frac{1}{\max\{P_1(a_i), P_2(a_i)\}}
$$

$$
\stackrel{(*)}{\leq} 1 + \log S + \sum_{i=1}^{M} P^*(a_i). \log_2 \frac{1}{P^*(a_i)} = H(U) + \log S + 1 \le H(U) + 2,
$$

where the inequality (*) uses the fact that $P^*(a_i) \leq \max\{P_1(a_i), P_2(a_i)\}\)$ for all $1 \leq$ $i \leq M$.

(d) Now let $l_i = \lceil \log_2 \frac{S}{\max\{P_1(a_i)\}}\rceil$ $\frac{S}{\max\{P_1(a_i),...,P_k(a_i)\}}$, and let us compute the Kraft sum:

$$
\sum_{i=1}^{M} 2^{-l_i} \le \sum_{i=1}^{M} 2^{-\log_2 \frac{S}{\max\{P_1(a_i),\dots,P_k(a_i)\}}} = \sum_{i=1}^{M} \frac{\max\{P_1(a_i),\dots,P_k(a_i)\}}{S} = 1.
$$

Since the Kraft sum is at most 1, there exists a prefix-free code where the length of the codeword associated to a_i is l_i . Since the code is prefix free, it must be the case that $\overline{l} \geq H(U)$. In order to prove the upper bounds, let P^* be the true distribution (which is either P_1 or ... or P_k). It is easy to see that $P^*(a_i) \leq \max\{P_1(a_i), \ldots, P_k(a_i)\}\$ for all $1 \leq i \leq M$. We have:

$$
\overline{l} = \sum_{i=1}^{M} P^*(a_i) . l_i = \sum_{i=1}^{M} P^*(a_i) . \left[\log_2 \frac{S}{\max\{P_1(a_i), \dots, P_k(a_i)\}} \right]
$$

$$
< \sum_{i=1}^{M} P^*(a_i) . \left(1 + \log_2 \frac{S}{\max\{P_1(a_i), \dots, P_k(a_i)\}} \right)
$$

$$
= \sum_{i=1}^{M} P^*(a_i) . \left(1 + \log_2 S + \log_2 \frac{1}{\max\{P_1(a_i), \dots, P_k(a_i)\}} \right)
$$

$$
= 1 + \log_2 S + \sum_{i=1}^{M} P^*(a_i) . \log_2 \frac{1}{\max\{P_1(a_i), \dots, P_k(a_i)\}}
$$

$$
\stackrel{(*)}{\leq} 1 + \log_2 S + \sum_{i=1}^{M} P^*(a_i) . \log_2 \frac{1}{P^*(a_i)} = H(U) + \log_2 S + 1,
$$

where the inequality (*) uses the fact that $P^*(a_i) \leq \max\{P_1(a_i), \ldots, P_k(a_i)\}\;$ for all $1 \leq i \leq M$. Now notice that $\max\{P_1(a_i), \ldots, P_k(a_i)\} \leq \sum_{j=1}^k P_j(a_i)$ for all $1 \leq i \leq M$. Therefore, we have

$$
S = \sum_{i=1}^{M} \max\{P_1(a_i), \dots, P_k(a_i)\} \le \sum_{i=1}^{M} \sum_{j=1}^{k} P_j(a_i) = \sum_{j=1}^{k} \sum_{i=1}^{M} P_j(a_i) = \sum_{j=1}^{k} 1 = k.
$$

We conclude that $H(U) \leq \overline{l} \leq H(U) + \log S + 1 \leq H(U) + \log k + 1$.

PROBLEM 5.

(a) We prove the identity by induction on $n \geq 1$. For $n = 1$, the identity is trivial. Let $n > 1$ and suppose that the identity is true up to $n - 1$. We have:

$$
I(Y_1^{n-1}; X_n) = I(Y_1^{n-2}, Y_{n-1}; X_n) \stackrel{(*)}{=} I(Y_1^{n-2}; X_n) + I(X_n; Y_{n-1}|Y_1^{n-2})
$$

$$
\stackrel{(**)}{=} \left(\sum_{i=1}^{n-2} I(X_n; Y_i|Y_1^{i-1})\right) + I(X_n; Y_{n-1}|Y_1^{n-2}) = \sum_{i=1}^{n-1} I(X_n; Y_i|Y_1^{i-1}).
$$

The identity $(*)$ is by the chain rule for mutual information, and the identity $(**)$ is by the induction hypothesis.

(b) For every $0 \leq i \leq n$, define $a_i = I(X_{i+1}^n; Y_1^i)$, and for every $1 \leq i \leq n$, define $b_i = I(X_{i+1}^n; Y_1^{i-1})$. It is easy to see that $a_0 = a_n = 0$. We have: $\sum_{n=1}^{\infty}$ $i=1$ $I(X_{i+1}^n; Y_i | Y_1^{i-1}) \stackrel{(*)}{=} \sum_{i=1}^n$ $i=1$ $\left(I(X_{i+1}^n; Y_1^i) - I(X_{i+1}^n; Y_1^{i-1})\right) = \left(\sum_{i=1}^n Y_i^i\right)$ $i=1$ a_i) – $\Big(\sum_{n=1}^{n}$ $i=1$ b_i $\stackrel{(**)}{=} \left(\sum_{n=1}^{n-1} \right)$ $i=0$ a_i) – $\left(\sum_{n=1}^{n} a_i\right)$ $i=1$ b_i) = $\left(\sum_{i=1}^n a_i\right)$ $i=1$ a_{i-1}) – $\Big(\sum_{n=1}^{n}$ $i=1$ b_i) = $\sum_{i=1}^{n}$ $i=1$ $\big(a_{i-1} - b_i\big)$ $=\sum_{n=1}^{\infty}$ $\frac{i=1}{i}$ $\left(I(X_i^n; Y_1^{i-1}) - I(X_{i+1}^n; Y_1^{i-1})\right) \stackrel{(***)}{=} \sum_{i=1}^n$ $i=1$ $I(Y_1^{i-1}; X_i | X_{i+1}^n).$

The identities (∗) and (∗∗∗) are by the chain rule for mutual information. The identity (**) follows from the fact that $a_0 = a_n = 0$, which implies that $\sum_{n=1}^n$ $i=1$ $a_i = \sum^{n-1}$ $i=0$ a_i .

PROBLEM 6.

(a) We can write the following chain of inequalities:

$$
Q^{n}(\mathbf{x}) \stackrel{1}{=} \prod_{i=1}^{n} Q(x_i) \stackrel{2}{=} \prod_{a \in \mathcal{X}} Q(a)^{N(a|\mathbf{x})} \stackrel{3}{=} \prod_{a \in \mathcal{X}} Q(a)^{nP_{\mathbf{x}}(a)} = \prod_{a \in \mathcal{X}} 2^{nP_{\mathbf{x}}(a) \log Q(a)}
$$
(1)

$$
= \prod_{a \in \mathcal{X}} 2^{n(P_{\mathbf{x}}(a) \log Q(a) - P_{\mathbf{x}}(a) \log P_{\mathbf{x}}(a) + P_{\mathbf{x}}(a) \log P_{\mathbf{x}}(a))}
$$
(2)

$$
= 2^{n \sum_{a \in \mathcal{X}} (-P_{\mathbf{x}}(a) \log \frac{P_{\mathbf{x}}(a)}{Q(a)} + P_{\mathbf{x}}(a) \log P_{\mathbf{x}}(a))} = 2^{n(-D(P_{\mathbf{x}}||Q) + H(P_{\mathbf{x}}))},
$$

where 1 follows because the sequence is i.i.d., grouping symbols gives 2, and 3 is the definition of type.

(b) Upper bound: We know that

$$
\sum_{k=0}^{n} \binom{n}{k} p^{k} (1-p)^{n-k} = 1.
$$

Consider one term and set $p = k/n$. Then,

$$
1 \ge \binom{n}{k} \left(\frac{k}{n}\right)^k \left(1 - \frac{k}{n}\right)^{n-k} = \binom{n}{k} 2^{n\left(\frac{k}{n}\log\frac{k}{n} + \frac{n-k}{n}\log\frac{n-k}{n}\right)} = \binom{n}{k} 2^{-nh_2\left(\frac{k}{n}\right)}
$$

Lower bound: Define $S_j = \binom{n}{i}$ $\binom{n}{j} p^j (1-p)^{n-j}$. We can compute

$$
\frac{S_{j+1}}{S_j} = \frac{n-j}{j+1} \frac{p}{1-p}.
$$

One can see that this ratio is a decreasing function in j. It equals 1, if $j = np+p-1$, so $\frac{S_{j+1}}{S}$ $\frac{S_{j+1}}{S_j}$ < 1 for $j = \lfloor np + p \rfloor$ and $\frac{S_{j+1}}{S_j} \ge 1$ for any smaller j. Hence, S_j takes its maximum value at $j = \lfloor np + p \rfloor$, which equals k in our case. From this we have that

$$
1 = \sum_{j=0}^{n} {n \choose j} p^{j} (1-p)^{n-j} \le (n+1) \max_{j} {n \choose j} p^{j} (1-p)^{j}
$$

$$
\le (n+1) {n \choose k} \left(\frac{k}{n}\right)^{k} \left(1 - \frac{k}{n}\right)^{n-k} = (n+1) {n \choose k} 2^{-nh_{2}(\frac{k}{n})}.
$$
 (3)

The last equality comes from the derivation we had when proving the upper bound.

(c) Since for every $\mathbf{x} \in T(P)$, $Q^n(\mathbf{x}) = 2^{-n(H(P) + D(P||Q))}$ (by part (a)) and $\frac{1}{n+1}2^{n(H(P))} \le$ $|T(P)| \leq 2^{n(P)}$ (by part (b)), we have

$$
\frac{1}{n+1}2^{-nD(P||Q)} \le Q^n(T(P)) \le 2^{-nD(P||Q)}
$$
